Estimating Velocity by Differentiation

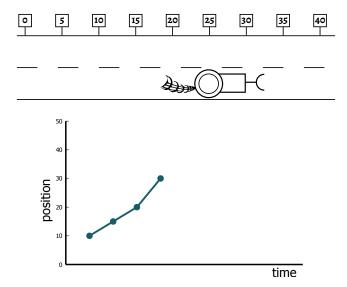

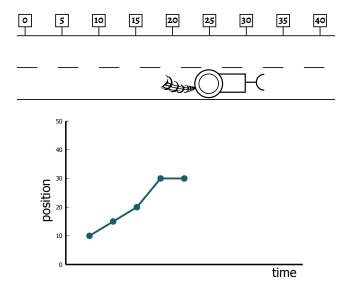

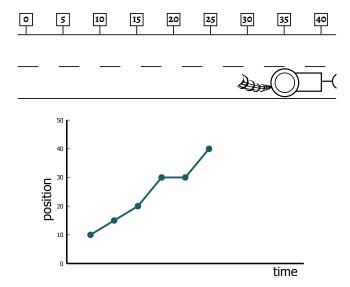

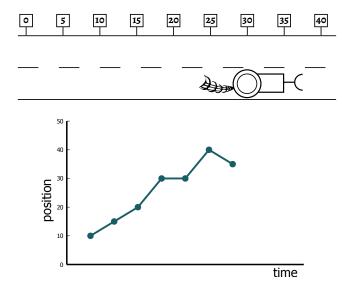

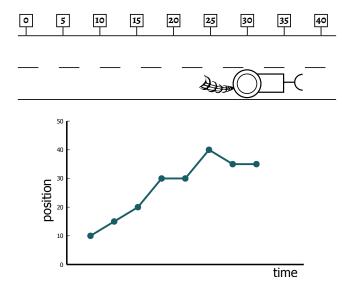

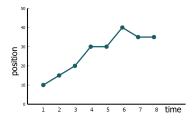

Exercise 1

- 1. Calculate the change of position between time 3 and 4. Next, calculate the rate of change of the position (= velocity) between time 3 and 4.
- 2. Do the same for the time between 3 and 5.
- 3. Now assume that the position is given as $f(t) = t^2$. Plot that function from time 0 to 3. Calculate the velocity between time 0 and 2. Draw a line through the points (0, f(0)) and (2, f(2)). How does the slope of the line relate to the velocity? Why? Next, do the same for the velocity between time 1 and 2, then between time 1.5 and 2.
- **4.** Think about what it would mean to calculate the velocity *at* time 2.

Formal Definition

Differentiable Function

▶ The **derivative of** f **at position** x_0 , short f'(x), is defined as

$$\lim_{x\to x_0} \frac{f(x) - f(x_0)}{x - x_0}$$

► This denotes the value of $\frac{f(x)-f(x_0)}{x-x_0}$ as x gets closer and closer to x_0 .

Differentiation as Limit Example

Statement: The derivative of $f(x) = x^2$ is f'(x) = 2x

Statement: The derivative of $f(x) = x^2$ is f'(x) = 2x

Calculus

Applying the formula

$$\lim_{x \to x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \to x_0} \frac{x^2 - x_0^2}{x - x_0}$$

Differentiation as Limit Example

- Applying the formula

$$\lim_{x \to x_0} \frac{f(x) - f(x_0)}{x - x_0} = \lim_{x \to x_0} \frac{x^2 - x_0^2}{x - x_0}$$

Simplifying

$$\lim_{x \to x_0} \frac{(x - x_0)(x + x_0)}{x - x_0} = \lim_{x \to x_0} \frac{(x - x_0)(x + x_0)}{x - x_0} = \lim_{x \to x_0} (x + x_0)$$

Differentiation as Limit Example
